

SAFETY 20 YEARS

The respirator that never stops.

The SE400 positive pressure respirator just never stops improving. Now in 2004, twenty years after its inception, S.E.A. introduces the SE400AT-2, a new generation of breathing protection with all the trusted features and many new ones.

- Positive pressure at 400 l/min, even during very hard work
- Battery power lasts for several hours
- Large range of industrial filters
- Special filters for emergency and rescue applications, including biological, chemical and radiological warfare agents
- Wide range of accessories, such as spectacles, communication, welding shields and pressurised protective suits
- Used the world over in industry, defence, police, health, emergency and domestic preparedness

The big news:

The SE400AT-2 boasts many innovative designs and accessories.

The fan unit can now be powered with dual batteries, eliminating the need for a mid-shift battery change. Although a single battery lasts for hours and can be changed without removing the mask, the dual battery system is ideal for use inside a protective suit.

A new battery management system can store up to 28 batteries, each automatically charged and kept in peak condition from a single power point.

Other new features include:

- Swivel elbow hose connections
- Angled regulator for greater field of vision
- Strong, watertight connectors
- Halo-butyl face piece
- Many more
