## 1. INTRODUCTION

In 1996, Congress passed Public Law 104-201 (Defense Against Weapons of Mass Destruction Act of 1996), directing the Department of Defense (DoD) to assist other federal, state, and local agencies in enhancing preparedness for terrorist attacks using weapons of mass destruction. The DoD responded by forming the Domestic Preparedness Program that same year. One of the objectives of the Domestic Preparedness Program is to enhance federal, state and local emergency and hazardous material (HAZMAT) response to nuclear, biological and chemical (NBC) terrorism incidents. As part of an effective response, emergency and HAZMAT personnel who are responding to an incident will use personal protective equipment (PPE) to protect them from exposure to chemical agents or biological agents.

## 2. OBJECTIVE

This study evaluated the performance of the SE-Shield suit [Safety Equipment America (SEA) Inc., Branford, CT, [http://www.sea.com.au/](http://www.sea.com.au/)] in a corn oil challenge aerosol. The SESHIELD Level B suit is a chemically impermeable suit specially made for use with the SE400 Powered Air Purifying Respirator (PAPR). When used, the SE400 PAPR exhausts into the suit which provides better performance, this feature makes it different from other Level B suits as dumping air into the suit is not standard practice. Corn oil was used to simulate biological or chemical particulates from 0.4 to $0.6 \mu \mathrm{~m}$ in diameter (typical military standard for the possible threat). This information is intended to evaluate the suit for its possible applications in the federal, state, and local emergency and HAZMAT areas. This is especially important if these personnel choose to include military chemical agent protection as a criterion for purchase.

## 3. TESTING

### 3.1 Test Facilities and Equipment

Testing occurred at the Protection Factor Test Facility, an ISO 17025 compliant facility, in Building E5604, at Aberdeen Proving Ground - Edgewood Area, Edgewood, MD 21010, on Saturday, December 7, 2002. A challenge aerosol concentration of $20-40 \mathrm{mg} / \mathrm{m}^{3}$, polydispersed corn oil aerosol having a mass median aerodynamic diameter (MMAD) of 0.4 to $0.6 \mu \mathrm{~m}$ (the Army Standard) was generated in a $10-\mathrm{ft} \times 20-\mathrm{ft} \times 32-\mathrm{ft}$ test chamber. The test chamber challenge aerosol was generated by atomizing liquid corn oil at room temperature using a Laskin nozzle. The Laskin nozzle produced a coarse aerosol cloud, which was directed into an impaction plate to remove the larger particles and yield an aerosol in the desired size range. The concentrated aerosol from the generator was diluted with filtered ambient air to control the challenge aerosol concentration in the exposure chamber.

A 6-decade, 45-degree off-axis light-scattering laser photometer, sampling at a flow rate of $1-2 \mathrm{~L} / \mathrm{min}$, was used to quantify concentration of the challenge and the in-suit corn oil aerosols. For a given particle size, the quantity of scattered light is proportional to the aerosol concentration. The photometer converted the quantity of scattered light to a voltage, which was then digitized and recorded by a microcomputer.

### 3.2 Preparation of Test Items

A total of eight SE-SHIELD suits were available for testing and all were prepared for the test. All suits were tested in the as-received condition so effects of aging, laundering, and temperature extremes is out of the scope of this test. The suits were probed in both the left neck region and the upper left arm region. Both sample lines were then connected by a ' Y ' connection, which then was attached to a photometer once the volunteer was inside the chamber (Figure 1).

Figure 1 - Probing Assembly
An SE400 PAPR was used in conjunction with the suit (Figure 2). The hoses on the PAPRs were replaced with new hoses, which contain a valve to dump a portion of air into the suit with the rest going into the facepiece. Also, the day prior to testing, all batteries for the PAPRs were discharged and then completely recharged so as to have a full charge for the test day. The SEA facepieces were a one-size-fits-all and no modifications were made to them for the test.

Figure 2 - SE400 PAPR

### 3.3 Test Procedure

On test day, 30 military volunteers entered the facility and from each some anthropometrical data were taken, including face length and width, height, waist, inseam and chest. Of the 30 volunteers, 16 were chosen to be in the test. These volunteers best fit the suit and the full facepiece due to the manufacturers size specifications. Their measurements can be found in Appendix A. ECBC personnel then oriented the volunteers by explaining the test, and each volunteer was asked to sign an informed consent agreement.

The first eight volunteers were then instructed to prepare for the test. They changed out of their clothes and into coveralls, removing their boots as well. ECBC and SEA personnel dressed each subject into the suit and PAPR. The subjects wore a pair of boots outside of the suit, but no outer gloves were worn. The boots were worn to prevent the tearing of the suit while walking. Donning procedures for the suit included duct taping the seam in the front and along side of the head (Figure 3). Once all suits were correctly donned, the PAPRs were turned on and each was checked with a flow meter to ensure it was producing the correct amount of airflow.

Figure 3 - ECBC and SEA Personnel Dressing the Volunteers for the Test
ECBC personnel then led the eight volunteers into the chamber and attached their sample tubes to the photometer, the latter was located outside of the chamber in the control room. Personnel from within the control room communicated to the volunteers to begin the test, consisting of the following exercises:

Part A (One minute each)

1. Normal Breathing
2. Bend Forward and Touch Toes
3. Jog in Place
4. Raise Arms Above Head and Look Upward
5. Bend Knees and Squat
6. Crawl on Hands and Knees
7. Stand, Fold Arms in Front of Chest and Twist Torso
8. Normal Breathing

Part B (Four minutes each)

1. Climb Step Ladder
2. Move Boxes from Floor to Table
3. Rest
4. Roll Walls and Ceiling
5. Bag Clothes
6. Rest
7. Loosen Bolts
8. Move Boxes from Floor to Table

ECBC personnel in the control room communicated each exercise to the volunteers. Once the volunteers completed one complete trial (parts A and B), they exited the chamber and took a few minutes rest. They then reentered the chamber for a second trial. The trials ( $1 \mathrm{~A}, 1 \mathrm{~B}$, 2 A or 2 B ) and exercises $(1-8)$ correspond to trial numbers and exercise numbers in the data listed in Appendix B. View Figures 4 and 5 for images of the volunteers performing the exercises.

Figure 4 - Volunteers Performing 'Loosen Bolts' Exercise

Figure 5 - Volunteers Performing 'Climb Step Ladder' Exercise
Once the first group of eight volunteers completed two trials the second group prepared to enter the chamber. The second group performed the same procedures as the first group. With 16 volunteers each doing two trials, there was a possibility of 32 results for each exercise.

## 4. DATA ANALYSIS

Suit performance was quantified in terms of a protection factor (PF). The PF was calculated by determining the ratio of the challenge aerosol concentration to the in-suit aerosol concentration as quantified by integrating the peak voltage output from the photometer over a time interval. A PF was calculated for each individual exercise $\left(\mathrm{PF}_{\mathrm{i}}\right)$ :

$$
P F_{i}=\frac{\text { ChallengeConcentration }}{\text { In }- \text { SuitConcentration }}
$$

The $\mathrm{PF}_{\mathrm{i}}$ 's for a trial were then used to calculate an overall PF for a volunteer $\left(\mathrm{PF}_{0}\right)$ as follows :

$$
P F_{o}=n\left(\sum_{i=1}^{n} \frac{1}{P F_{i}}\right)^{-1}
$$

Where $n$ is the number of exercises. The $\mathrm{PF}_{\mathrm{o}}$ is affected most by the smallest $\mathrm{PF}_{\mathrm{i}}$. Under the conditions of this test and the sensitivity of the photometer, the maximum PF that can be reported is 100,000 . In Appendix B , the $\mathrm{PF}_{\mathrm{i}}$ is listed under each exercise and the $\mathrm{PF}_{\mathrm{o}}$ is listed under Average Fit (AVEFIT).

## 5. RESULTS AND DISCUSSION

The test data are summarized in Tables 1 and 2. The first column lists PF ranges. The second column is the number of test trials falling within each PF range. The second column is the number of test trials falling within each calculated PF range. The third column presents the cumulative-percentage of test trials that resulted in a PF below the upper limit of the range and the fourth column presents the percentage of trials that exceed the lower limit of the range shown.

Table 1 - Part A Results

| PF | Frequency | Cumulative \% | Pass \% |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 0.00 | 100.00 |
| $0-10$ | 0 | 0.00 | 100.00 |
| $10-20$ | 0 | 0.00 | 100.00 |
| $20-50$ | 0 | 0.00 | 100.00 |
| $50-100$ | 0 | 0.00 | 100.00 |
| $100-500$ | 1 | 3.33 | 96.67 |
| $500-1000$ | 3 | 13.33 | 86.67 |
| $1000-1667$ | 2 | 20.00 | 80.00 |
| $1667-2000$ | 2 | 26.67 | 73.33 |
| $2000-6667$ | 21 | 96.67 | 3.33 |

| $6667-10000$ | 1 | 100.00 | 0.00 |
| :---: | :---: | :---: | :---: |

Table 2 - Part B Results

| PF | Frequency | Cumulative \% | Pass \% |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 0.00 | 100.00 |
| $0-10$ | 0 | 0.00 | 100.00 |
| $10-20$ | 0 | 0.00 | 100.00 |
| $20-50$ | 0 | 0.00 | 100.00 |
| $50-100$ | 0 | 0.00 | 100.00 |
| $100-500$ | 2 | 7.69 | 92.31 |
| $500-1000$ | 8 | 38.46 | 61.54 |
| $1000-1667$ | 1 | 42.31 | 57.69 |
| $1667-2000$ | 1 | 46.15 | 53.85 |
| $2000-6667$ | 11 | 88.46 | 11.54 |
| $6667-10000$ | 3 | 100.00 | 0.00 |

The suit achieved $100 \%$ passing at a PF of 100 for both parts A and B. The results from Part A are slightly better than Part B because it is a shorter amount of exercises, while Part B is much longer and the subjects have a larger chance of breaking a seal. The results from the "Roll walls and ceiling" exercise are much lower than the average fit value. This exercise in particular is one, which creates a leak in this particular suit. One may notice that that total frequencies do not add up to 32 total trials. This is because some data had to be removed due to human error. Data skewed by human error does not accurately portray the performance of the suit. This data is not included in Appendix B.

## 6. CONCLUSION

The SE-SHIELD Suit with the SE 400 PAPR performed very well as compared to historical data of other commercially available negative pressure Level B suits. Historical testing of Level B suits have given results of a PF of 2 through 10. By pressurizing the suit, PF values have increased to much higher numbers thus greatly increasing the performance. Reports detailing findings of other Level B suit performance can be found at the Homeland Defense website: http://hld.sbccom.army.mil/ip/reports.htm\#suits.
